Title – Hospital Management System

Abstract

A Hospital management system will be created. It will have 3 different users. They include the doctor, patient and the admin/receptionist. During creation of a user the user will enter his/her role and according to the role user will get connected to the required database.

The patient will be able to book appointments on this database. The doctor can view his schedule and see his appointments. Moreover, the doctor can provide the medicines and give the solution to the problem. The receptionist/admin will be in charge of appointing the patients to the respective doctors depending upon symptoms and doctor department. The receptionist can also remove the data or edit it. A database for patient-doctor appointment will be created which will contain all the appointments of different patients and doctors and each user will have specific permission and visibility to view this database.

Introduction

Booking an appointment in a hospital is a tedious and tiring process. Often the patient either has to call the hospital or physically go to the hospital to get a appointment. The receptionist/admin will have to comb through schedules to see if a doctor is free and available on that time. Even doctors need to know their patients and also about the medicines in the hospital.

To reduce all of this workload a simple Hospital Management System can be created. It will have a simple interface where the patient can book appointment, the receptionist can assign doctors and the doctor can see his/her schedule and help the patient. It is easy to manage the database and all the records will be stored in a virtual environment thus saving paper and money.

Literature Study

The following links provide a brief explanation and insight on Hospital Management System-

Methodology and Tools

Front End – Python 3.7 with Tkinter

Python 3.7 was used as a frontend tool with Tkinter being used to give it GUI (Graphical User Interface).

Tkinter is a GUI tool used to make applications with python.

A client-connector was downloaded to connect python with the MySQL server and database. The connector is named as mysql-connector-python.

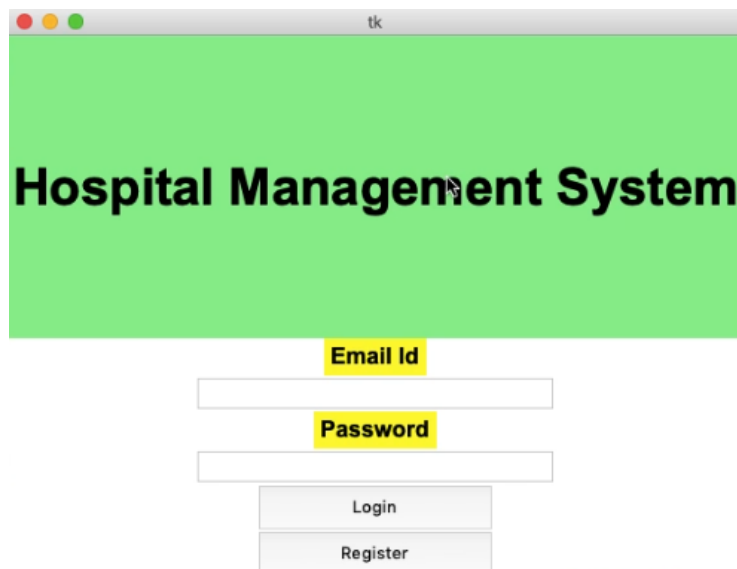

Database - MySQL

One of the most popular SQL databases which is open source. A browser for viewing the database MySQL Workbench was also used. This was to facilitate easier Viewability of the database schema and table

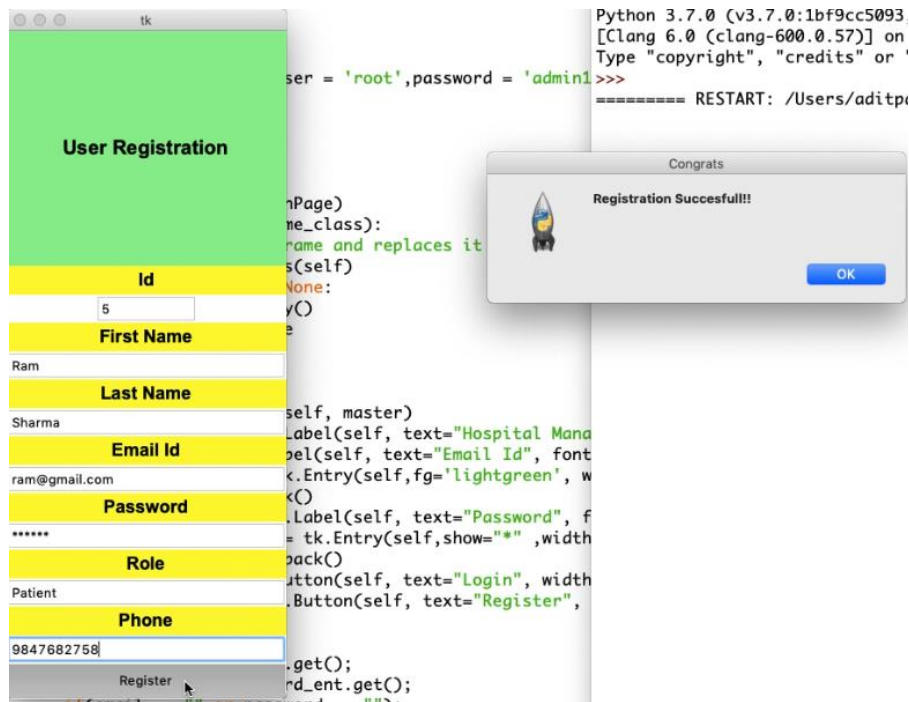

Experiment and Result

We illustrate this process with a complete appointment being booked. We register a user as a patient and then book an appointment, the receptionist assigns the doctor and the doctor gives the solution to the issue of the patient. The patient can then view his/her results.

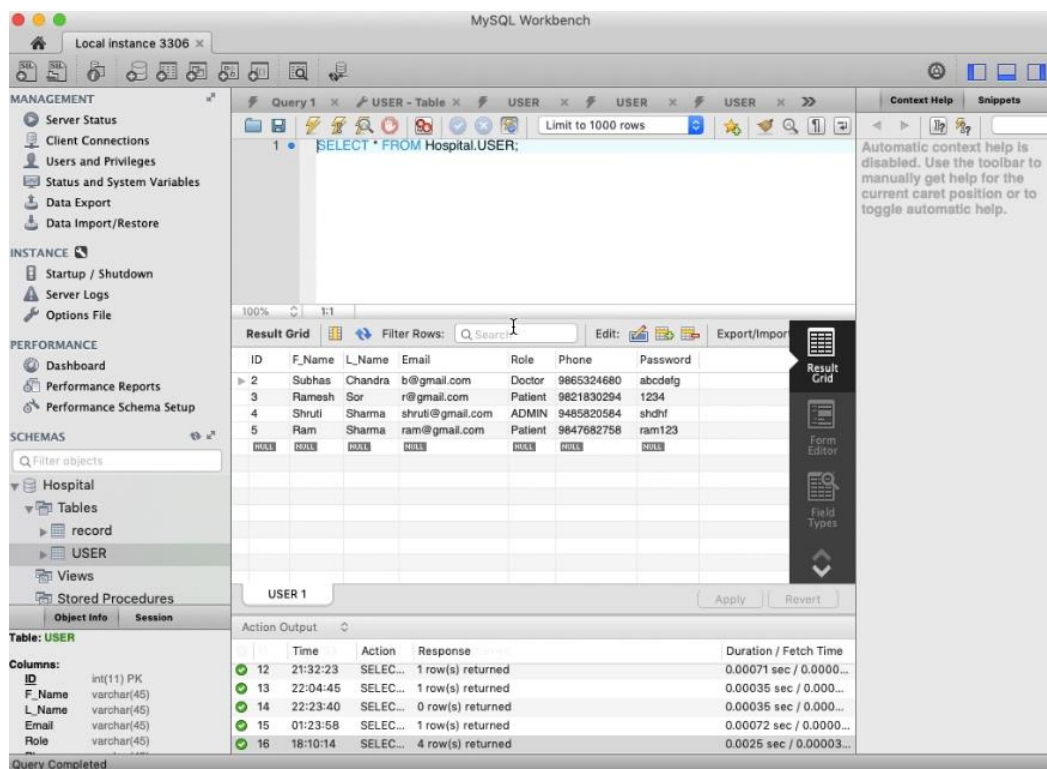

This is the login screen, the home screen.

Now we register as a patient Ram

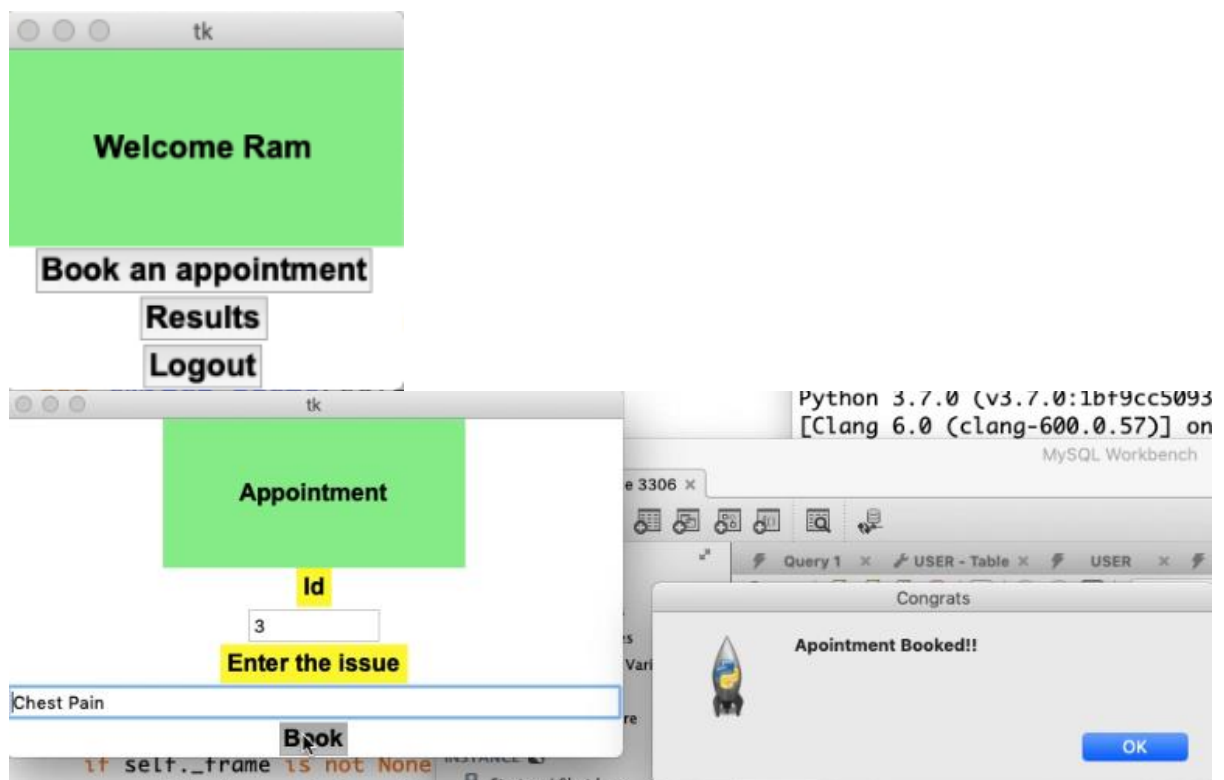

This is the database where the value of the table user has been updated.

We have logged in successfully

Now we book an appointment

Here we see the record table getting updated

The screenshot shows the MySQL Workbench interface. The left sidebar displays the 'SCHEMAS' tree with 'Hospital' expanded, showing 'Tables' and 'record'. The main window shows a query result for 'SELECT * FROM Hospital.record;'. The result grid displays the following data:

ID	p_name	p_id	d_name	d_id	issue	solution	medicine
1	Ramesh	3	Subhas	2	Neck and Cranium	Apply Lotion and rest	Paracetamol
3	Ram	5	NULL	NULL	Chest Pain	NULL	NULL
NULL	NULL	NULL	NULL	NULL	NULL	NULL	NULL

The 'record 1' tab is active, showing the 'Action Output' table with the following data:

ID	Time	Action	Response	Duration / Fetch Time
13	22:04:45	SELEC...	1 row(s) returned	0.00035 sec / 0.000...
14	22:23:40	SELEC...	0 row(s) returned	0.00035 sec / 0.000...
15	01:23:58	SELEC...	1 row(s) returned	0.00072 sec / 0.0000...
16	18:10:14	SELEC...	4 row(s) returned	0.0025 sec / 0.00003...
17	18:11:18	SELEC...	2 row(s) returned	0.00052 sec / 0.0000...

Now we login as the receptionist and assign a doctor to the patient

The screenshot shows the 'Hospital Management System' login interface. The title bar is 'tk'. The main window has a green background with the text 'Hospital Management System'. Below the title, there are input fields for 'Email Id' (containing 'shruti@gmail.com') and 'Password' (containing '*****'). There are 'Login' and 'Register' buttons. A 'Congrats' dialog box is open, displaying a rocket icon and the text 'Successful!!' with an 'OK' button. The background shows a MySQL Workbench window with a query result table:

F_Name	L_Name	Email	Role	Phone
Subhas	Chandra	b@gmail.com	Doctor	98653244
Ramesh	Sor	r@gmail.com	Patient	98218301
Shruti	Sharma	shruti@gmail.com	ADMIN	94858201
Ram	Sharma	ram@gmail.com	Patient	98476821

Welcome Admin

Enter Appointment Id

3

Update Appointment

Delete Appointment

Logout

Patient Name

Ram

Patient Id

5

Appointment Id

3

Issue

Chest Pain

Doctor Name

Subhas

Doctor Id

2

Python 3.7.0 (v3.7.0:1bf9cc5093, [Clang 6.0 (clang-600.0.57)] on
MySQL Workbench

Query 1 x USER - Table x USER x

Congrats

Values Updated

OK

100% 1:1

Result Grid Filter Rows: Q Search

Now we login as the doctor

Hospital Management System

Email Id

b@gmail.com

Password

Login

Register

Python 3.7.0 (v3.7.0:1bf9cc5093, [Clang 6.0 (clang-600.0.57)] on
MySQL Workbench

Query 1 x USER - Table x USER x

Congrats

Successful!!

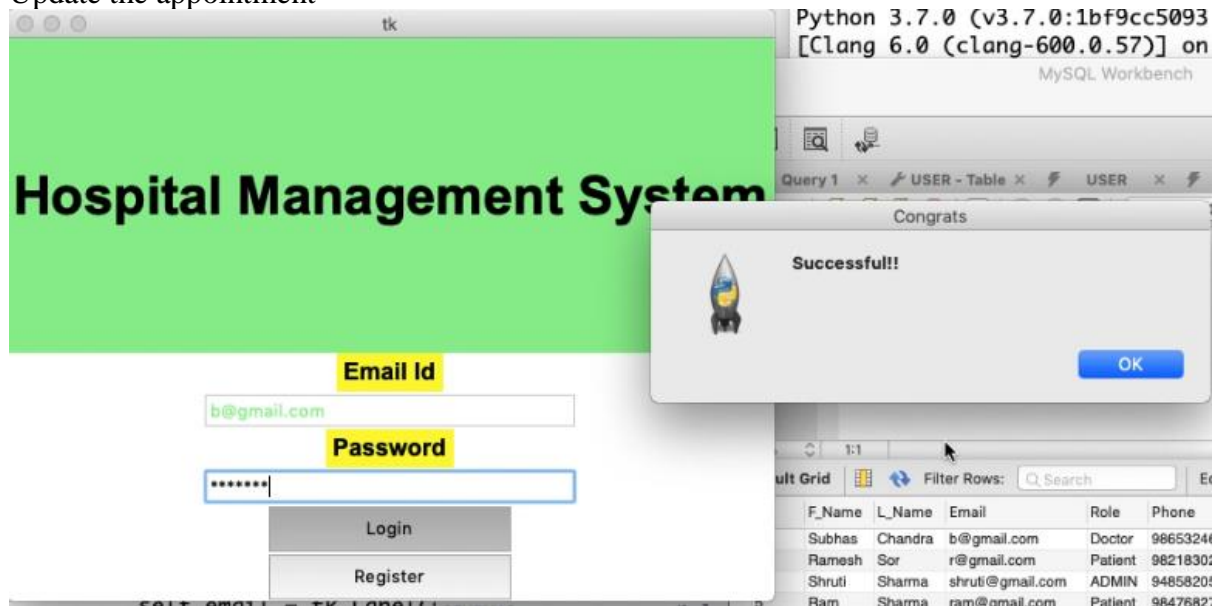

OK

1:1

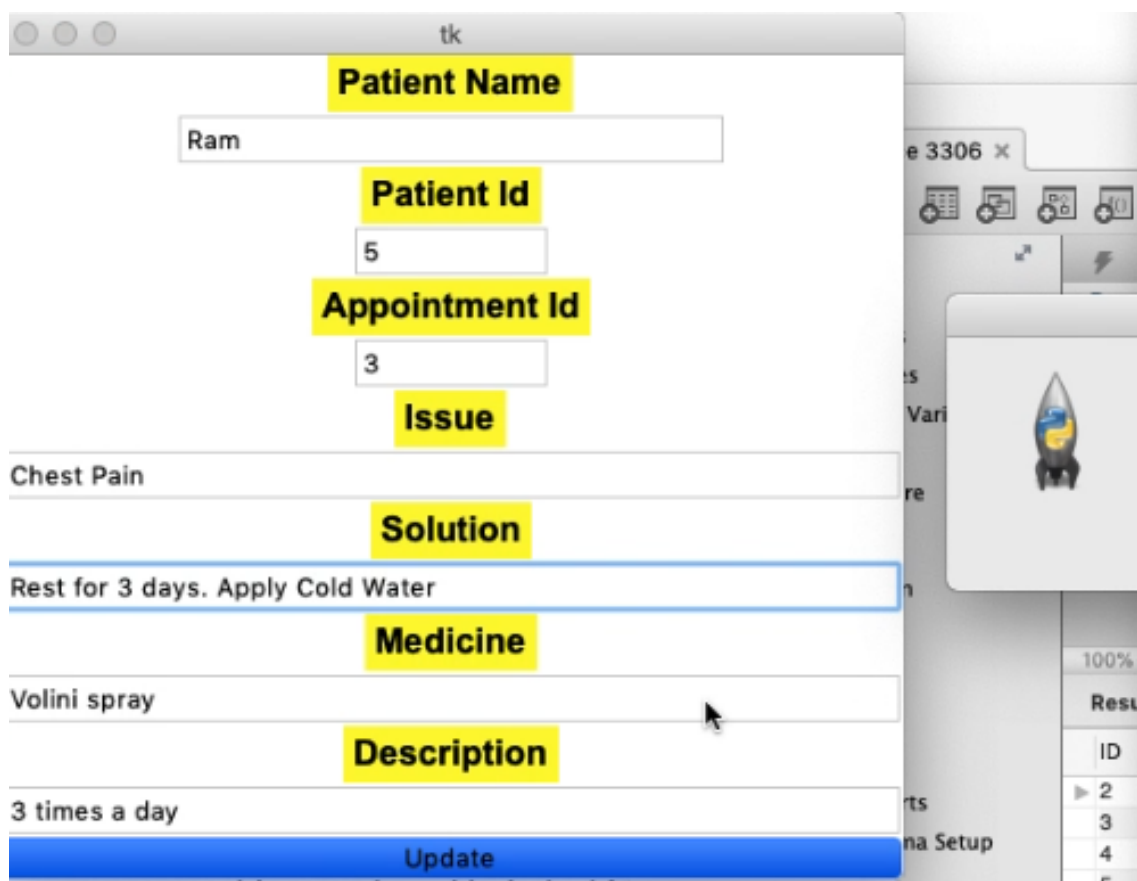

Result Grid Filter Rows: Q Search

F_Name	L_Name	Email	Role	Phone
Subhas	Chandra	b@gmail.com	Doctor	9865324
Ramesh	Sor	r@gmail.com	Patient	9821830
Shruti	Sharma	shruti@gmail.com	ADMIN	9485820
Ram	Sharma	ram@gmail.com	Patient	9847682

Update the appointment

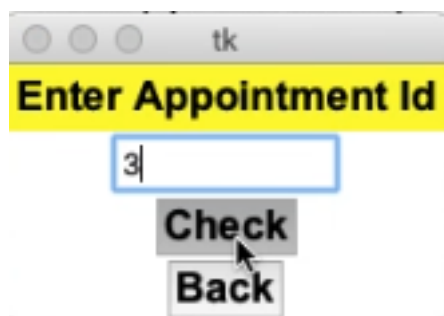

And Update the field

Now we login back as the patient

Look at the results and and enter the id

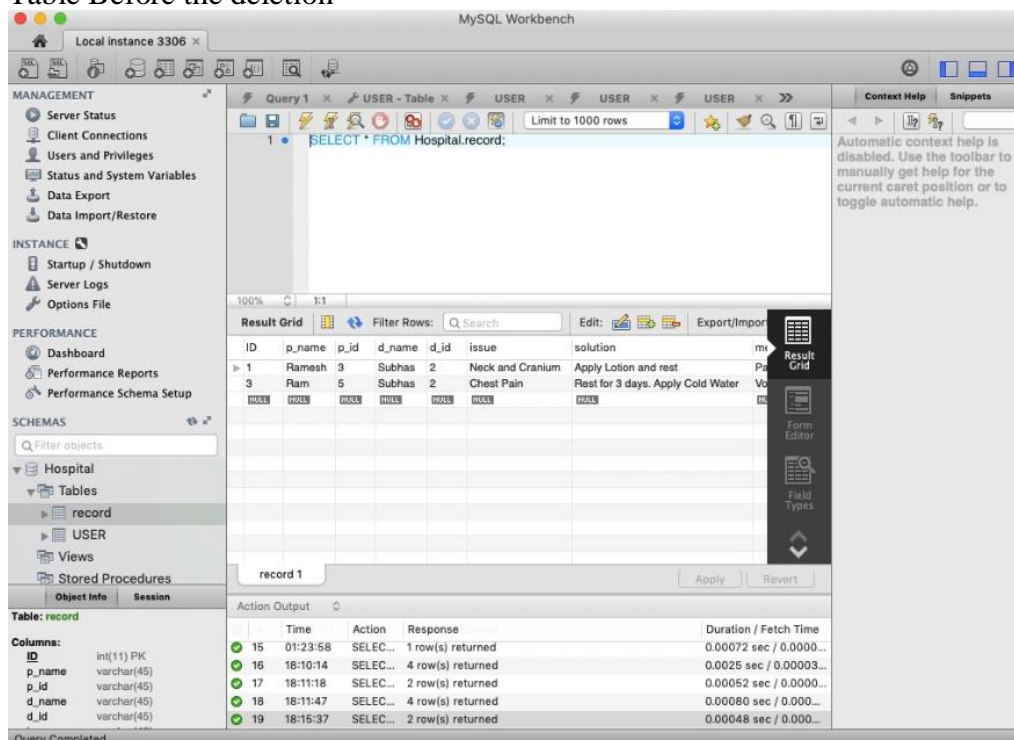

The screenshot shows a Tkinter window titled 'tk' with a yellow header 'Patient Name'. Below the header are several input fields and labels:

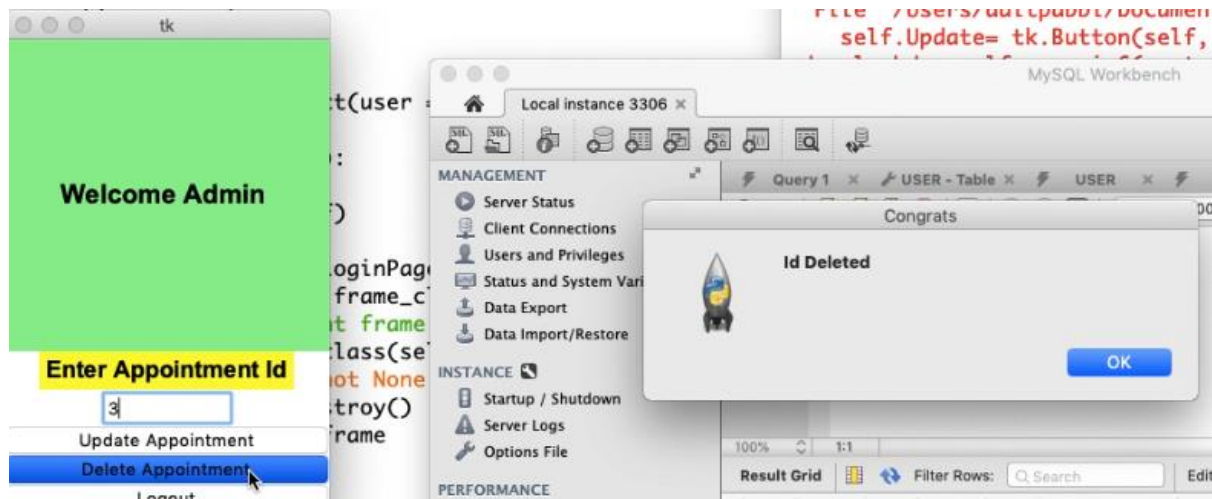

- Patient Name: Ram
- Patient Id: 5
- Appointment Id: 3
- Issue: Chest Pain
- Doctor: Subhas
- Doctor Id: 2
- Solution: Rest for 3 days. Apply Cold Water
- Medicine: Volini spray
- Description: 3 times a day
- Finish

Now since the results have come, we can delete the appointment. This can be done by the receptionist

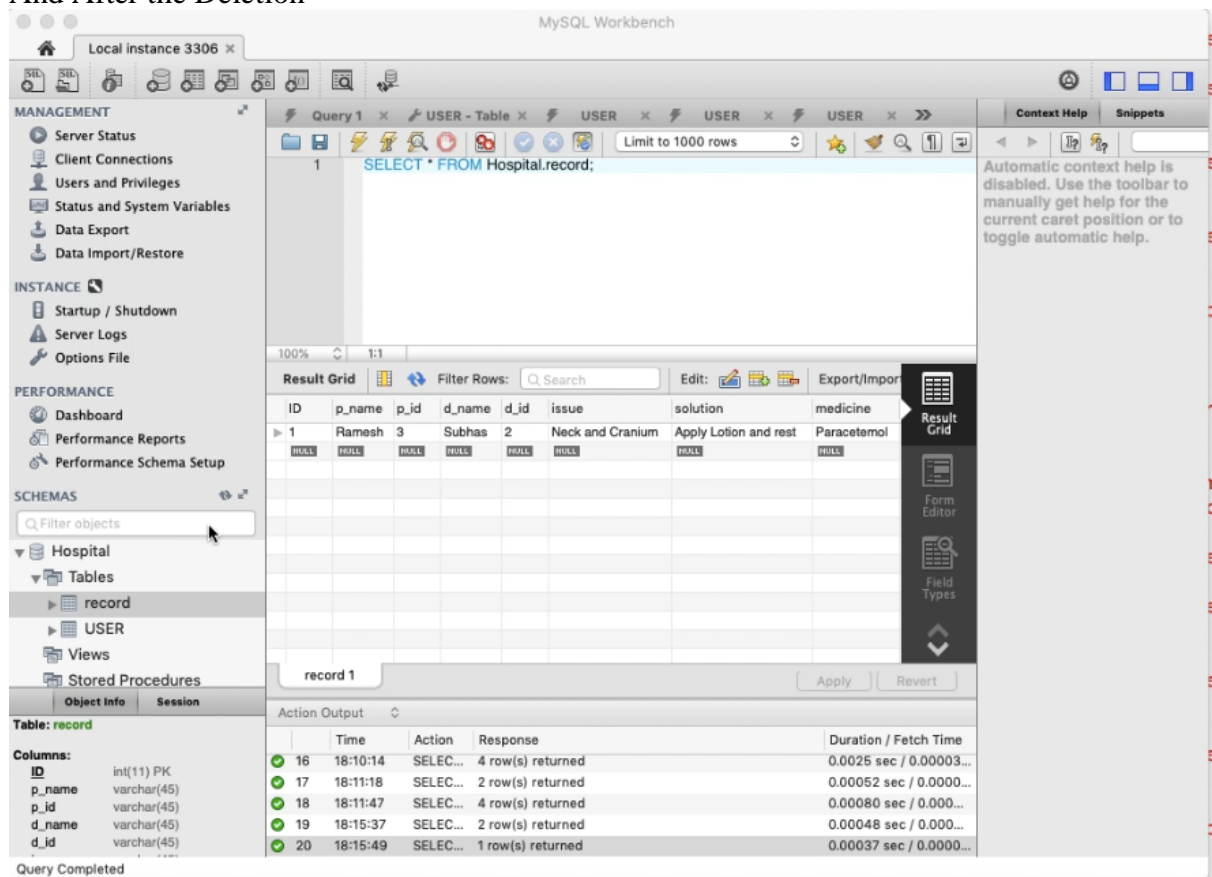

And Delete it
Table Before the deletion

And After the Deletion

Thus we illustrated the operation of **Insertion** by the patient, **Updating** by the doctor and the receptionist, **Selection** by the patient and **Deletion** by the receptionist.

Conclusion

This is a simple hospital management system which can be used instantly. However, this is still a prototype and other additional functionalities can be added to make it more useful like a billing system, laboratories, even other hospitals. We can also model it better to the real world demands. We could use other databases to reduce the access time and also make it more interactive. Moreover we can always extend this to multiple hospitals and make a website for the people to access it.
